

Task: Design and Implement a CRUD Blog app

Description:

Design and implement a CRUD app using node.js/express js as back end and a front end using React.

You will need to create database with mongoDB to reflect the database structure given below.

You will be required to do the following

Implement a Create/Editpage for Blogs with following inputs

- Blog heading
- Blog body
- Posted date
- author

User registration (only registered user can post the blogs)

- User name
- Email
- Password
- User profile picture

Page to view blogs and another page to read the selected blog

Implement a page to display the information of the user(User Profile).

It is a must to use validation when saving or updating data. It is recommended to have front end and back end validations.

Validation and runtime errors should be handled appropriately using readable messages. Data types and required attributes should be according to DB structure
